ARINOX

Arinox AI | Enterprise AI Implementation Experience & Government Applications

Secure, Governed and Operational AI Across Enterprise and Critical Environments

Practical implementation experience

Sovereign, secure and governed AI

Potential application across government operations

DOCUMENTED PLATFORM CAPABILITY

Arinox AI: Making AI Operational Inside Existing Systems and Workflows

Arinox is an AI transformation company. We take enterprises, governments and BFSI organisations through the complete AI journey — strategy, solution design, deployment, integration and ongoing operations.

WHAT WE DO

We set up AI inside your organisation and stay with you through the full transformation — from the first roadmap to running AI in daily operations.

WHAT WE ARE NOT

We are not a chatbot company and we do not simply sell AI tools.

Beyond demonstrations: thirteen documented implementations, including deployments described as in production (HPE; Tech Mahindra x Bank of Baroda) and in active deployment (Minera Steel).

OUR TEAM

ARINOX

AI strategy, solution design, implementation and long-term managed services

OUR PLATFORM

KOGO OS

Where AI agents are built, run and monitored — 250+ AI models, 500+ connectors, 100+ ready-made agents

YOUR CHOICE OF SETUP

DEPLOYMENT

Public cloud (AWS, GCP, Azure), private cloud, or on your premises with CommandCore™

WHAT YOU ALREADY USE

YOUR SYSTEMS

SAP, Oracle, Salesforce, Microsoft 365, Active Directory — connected, not replaced

POTENTIAL APPLICATION

From Implemented Use Cases to Government Applications

The implementations that follow were delivered for enterprise and defence clients; none is presented as a Government of Karnataka deployment. They evidence capabilities that may be relevant to government administration.

AREAS OF POTENTIAL RELEVANCE		IN CASE STUDIES

07	AI-assisted analysis and cross-functional visibility	CS 06 · 07 · 08

HOW TO READ THIS DOCUMENT

EXISTING IMPLEMENTATION

Something Arinox has built and deployed for a client, as documented in the case studies.

DOCUMENTED PLATFORM CAPABILITY

A feature of the KOGO OS platform described in Arinox's own materials.

POTENTIAL APPLICATION

An illustrative way a capability could be adapted. Subject to departmental requirements.

PROPOSED APPROACH

A suggested way to begin. Not a commitment, timeline or budget.

DOCUMENTED PLATFORM CAPABILITY

Why Sovereign AI Matters for Government

Government bodies hold regulated and sensitive data. Where AI runs, who controls it and who is accountable for it are decisions of sovereignty, not just technology.

THE RISK OF OPEN, PUBLIC AI

1 **Company data leaves the organisation**

When staff use public AI tools, client information, internal data and business plans are sent to servers owned by another company.

2 **Compliance risk**

Banks, hospitals and government bodies are not permitted to share regulated data with public AI services — yet most AI tools require it.

3 **No accountability**

There is no clear record of what data the AI used, who approved its answer, or who is responsible for the decision.

4 **Dependence on outside vendors**

Prices, AI models and usage policies can change at any time, without the organisation having any say.

SOVEREIGN CONTROL IN PRACTICE

Control over where AI runs

AI runs where you choose — public cloud, private cloud or your own premises — and your data stays under your control.

Accountability by design

Every AI action is recorded, access is given by role, and important decisions go to a person for approval.

Freedom to choose models

Support for 250+ AI models on open standards, so you can switch models without rebuilding anything.

PROVEN IN DEFENCE · CS 01 · INDIAN ARMY

100% air-gapped, zero external connectivity. Sovereign: Indian-built, Indian-controlled.

18 slide 28 — **AI-Enabled Retail Store Operations** — Mobile and Electronics Retail Chain

19 slide 29 — **AI-Assisted Email Classification and Departmental Routing** — Large Banking Institution

EXISTING IMPLEMENTATION | DOCUMENTED PLATFORM CAPABILITY

A Mission-Critical Example: Sovereign AI for Defence

Deployment control, access governance and infrastructure choice matter most where data is sensitive. The Indian Army implementation is the principal example.

IMPLEMENTED EXAMPLE · CS 01 · INDIAN ARMY

100% — Air-gapped, zero external connectivity

Sovereign — Indian-built, Indian-controlled

Centre + Edge — On-Prem & VPC/NDC Deployment

Deployed in two modes - a fully air-gapped on-premise instance for classified centre operations, and a VPC/NDC-hosted instance for extended reach

Full case study on slide 7. This architecture is not presented as suitable for every government workload without assessment.

Deployment control

AI runs where you choose — public cloud, private cloud or your own premises — and your data stays under your control.

Runtime: On Prem · AWS · GCP · Azure · VPC · AirGapped

On-premises option: CommandCore™

A ready-to-use hardware and software system, powered by NVIDIA and running KOGO OS.

XL: data centre scale · M: department scale · S: edge & remote sites

Access governance

Every AI action is recorded, access is given by role, and important decisions go to a person for approval.

CASE STUDY 01 · CLIENT DEPLOYMENT

Sovereign AI for Situational Analysis & Decision Support

Indian Army

Defence | KOGO OS + CommandCore - On-Prem Air-Gapped & VPC/NDC, with Edge Deployment

THE CHALLENGE

Real-time situational analysis and decision support required slow, manual data correlation across isolated systems at both centre and edge, with no acceptable path through commercial cloud AI given the sovereignty risk to classified defence data.

WHAT WAS BUILT

- Interpretation and Analysis engines correlate real-time situational and operational data, running multi-agent decision loops to support command-level decision-making
- Deployed in two modes - a fully air-gapped on-premise instance for classified centre operations, and a VPC/NDC-hosted instance for extended reach
- Edge devices extend situational awareness and decision support to forward locations, synchronising back to the centre for a unified operating picture

THE RESULT IN NUMBERS

100%

Air-gapped, zero external connectivity

TQR

Compliant agentic OS platform

Sovereign

Indian-built, Indian-controlled

Centre + Edge

On-Prem & VPC/NDC Deployment

THE RESULT

A single sovereign platform now delivers real-time situational analysis and decision support across centre and edge, running fully air-gapped on-premise and on VPC/NDC infrastructure, with every operation compounding the system's own knowledge base over time.

CASE STUDY 02 · CLIENT DEPLOYMENT - NAME CONFIDENTIAL

Autonomous Incident Management (NERV)

Confidential Client - Manufacturing & Operations

Manufacturing & Operations | Coverage: IT, OT/SCADA, Logistics, MES, DevOps, Cybersecurity

THE CHALLENGE

Incidents scattered across siloed systems with no cross-domain view - teams responding reactively, with engineers spending time routing tickets instead of resolving root causes.

WHAT WAS BUILT

- **Detection and Analysis:** real-time signal ingestion across SCADA, ERP, MES and logistics, with cross-domain root-cause reasoning
- **Resolution:** proposes and auto-executes pre-approved fixes; complex decisions route to a human with full context pre-filled
- **Learning:** every incident response feeds back into evaluation baselines, continuously improving on the client's patterns

THE RESULT IN NUMBERS

Real-time
Cross-Domain Detection

Auto-routed
Resolution Actions

↓ MTTR
Mean Time to Resolve

100%
Operational Coverage

THE RESULT

Delivered for a confidential manufacturing client - KOGO OS connects every system through 500+ native tool connectors, with KOGO WorkSpace as the single incident cockpit, cutting MTTR and catching issues before they reach production.

CASE STUDY 03 · CLIENT DEPLOYMENT - NAME CONFIDENTIAL

Predictive Maintenance & Ops Automation

Confidential Client - Asset-Intensive Manufacturing

Manufacturing & Asset-Intensive Operations | On-prem / VPC / Edge

THE CHALLENGE

Unplanned downtime averages $260K per hour in heavy industry - reactive maintenance, disconnected sensor data, and institutional knowledge walking out the door as engineers retire.

WHAT WAS BUILT

- **Sensor and Prediction:** continuous vibration, temperature and acoustic data from IoT/SCADA feeds failure forecasts and Remaining Useful Life estimates
- **Scheduling:** autonomous work-order generation, covering parts list, skill requirements and timing, routed for engineer approval
- **Learning:** every maintenance outcome feeds back into the prediction models, compounding knowledge across every shift

THE RESULT IN NUMBERS

↓ 20%
Maintenance Cost

↑ 15%
Production Uptime

Days Early
Fault Warning Window

Proactive
vs Reactive Culture

THE RESULT

Delivered for a confidential manufacturing client - 20% lower maintenance costs and 15% higher uptime, replacing a reactive culture with days-early failure warnings, against an industry baseline of $260,000 per hour in unplanned downtime.

CASE STUDY 04 · CLIENT DEPLOYMENT

Enterprise-Scale Data Intelligence

Coforge

Coforge - OHC (Aerospace & Defense)

Supply Chain / Procurement | KOGO OS - Multi-Agent Document Intelligence Pipeline

THE CHALLENGE

Tens of thousands of aircraft part line items across PDFs, spreadsheets and scans - manual lookup and validation on every part, with cost growing linearly with volume.

WHAT WAS BUILT

- **Multi-agent pipeline:** Vision AI extracts, an LLM classifies, and OCR digitises, processing a page in 2-3 seconds
- Cross-referencing against vendor databases and schemas, with human review only on flagged anomalies
- Near-zero marginal cost per additional item, so the pipeline scales without adding headcount

THE RESULT IN NUMBERS

97.4%
Cost Reduction

1,800x
Faster Processing

100K+
Items at Production Scale

$128K+
Annual Savings

THE RESULT

Per-row processing time fell from 6 minutes to about 0.2-0.3 seconds (1,200-1,800x faster); a 15-row page fell from 90 minutes to 2-3 seconds, and turnaround dropped from weeks to hours.

CASE STUDY 05 · CLIENT DEPLOYMENT

AI-Powered Expense Management Agent

Coforge

Coforge - Internal Operations

Finance & HR Operations | KOGO OS - Conversational AI Agent + HITL Workflow

THE CHALLENGE

Travel and expense claims were entirely manual on top of SAP and MS Teams - no real-time visibility, frequent SAP rework, zero systematic audit trail.

WHAT WAS BUILT

- Conversational AI on MS Teams with adaptive OCR, so employees submit expenses via chat with real-time currency conversion
- SAP iEngage integration, so validated claims are pushed directly to SAP, eliminating manual entry and rework
- HITL dashboard, where finance reviews only flagged exceptions, with an immutable audit trail of every action

THE RESULT IN NUMBERS

83%
Straight-Through Processing

85%
Faster Submission

95%+
SAP Error Reduction

$40.8K
Annual Savings / 1,000 Employees

THE RESULT

Claim submission fell from 15-20 minutes to 2-3 minutes; end-to-end turnaround from 5-7 days to 1-2 days, an 83% straight-through rate, with finance reviewing only the exceptions.

CASE STUDY 06 · CLIENT DEPLOYMENT

Golden Record & Enterprise Data Unification

Asian Paints Ltd - Enterprise Data & Customer Intelligence

FMCG / Manufacturing & Distribution | Golden Record & Unified Data Layer

THE CHALLENGE

Operations spanning 7+ business units, 15+ disconnected data systems and 10+ touchpoints - fragmented, siloed data with no single layer to stitch records across systems or business units.

WHAT WAS BUILT

- Consolidated 15+ data systems and 10+ touchpoints into a single governed data layer, with a Golden Record framework stitching identities and records across every business unit
- Built a full-funnel intelligence layer combining transactional, behavioural and engagement data into one queryable structure, replacing manual cross-referencing
- Deployed AI-driven segmentation and recommendation models on the unified layer, with real-time activation across every downstream system

THE RESULT IN NUMBERS

15+
Data Systems Unified

7+
Business Units Connected

Golden Record
Framework Deployed

GCP-Native
Cloud Architecture

THE RESULT

Multiple disconnected systems and business units now operate off a single source of truth, with unified visibility across the full data lifecycle and materially faster time-to-insight for cross-functional decisions.

CASE STUDY 07 · CLIENT DEPLOYMENT

Real-Time Context Orchestration Engine

Asian Paints Ltd

FMCG, Customer & Front-Line Operations | Real-Time Signal Orchestration Layer

THE CHALLENGE

Customer and product data scattered across disconnected systems, with front-line teams manually searching multiple portals per interaction - repeated questions, longer handling time, and inconsistent context at the point of conversation.

WHAT WAS BUILT

- Consolidated six core signal types - identity, transactions, open issues, interaction history, behaviour patterns and engagement channels - into one real-time context layer
- Built a real-time algorithmic resolution engine running multi-channel match layers within milliseconds, surfacing the full picture the instant a query comes in
- Delivered instantaneous context to front-line dashboards, eliminating repeated background searches and manual cross-referencing across systems

THE RESULT IN NUMBERS

0.4s
Avg Context Latency

6
Core Signals Unified

Real-Time
Algorithmic Resolution

Multi-Channel
Match Layer

THE RESULT

Front-line teams now get full context the moment they need it instead of searching across systems - cutting repeated questions, shortening handling time, and giving every conversation continuity from first contact onward.

CASE STUDY 08 · CLIENT DEPLOYMENT

Real-Time Intelligence Across Procurement, Sales & Finance

Minera Steel

Steel / Metals Manufacturing | KOGO OS - Procurement, Sales & Finance Agents on SAP on-prem APIs

THE CHALLENGE

Procurement and commercial teams tracked global commodity indices and landed costs manually across siloed portals, with no centralized, conversational view for cross-functional leadership.

WHAT WAS BUILT

- A Procurement Index Monitoring Agent tracks commodity benchmarks (coal, iron ore, scrap steel) and alerts buyers automatically
- Sales dashboard agent on SAP on-prem APIs, with KPI tiles, natural-language widgets, and three-layer Summary, Research and Data views
- Unified Finance API Mesh links about 160 whitelisted Finance APIs into the agent network for cross-checking against market moves

THE RESULT IN NUMBERS

160+
Finance APIs Mapped for Integration

3 Agents
Procurement, Sales & Finance

Steel / Metals
Industry

Direct SAP APIs

THE RESULT

Automated alerts now reach buyers the moment commodity prices move, and leadership queries live sales data in plain language instead of waiting on manual reports - a real-time, conversational layer across procurement and sales.

CASE STUDY 09 · CLIENT DEPLOYMENT

AI-Powered Infrastructure Service Delivery

Hewlett Packard Enterprise (HPE)

IT Infrastructure & Hybrid Cloud, Managed Services | HCN + KOGO OS = HCN+ | In Production, Global Rollout

THE CHALLENGE

HPE's Hybrid Cloud Network was a powerful orchestration platform but a manual bottleneck: every deployment needed a skilled engineer across 6+ modules, approvals were reactive, and Day 2 operations meant switching between 3-5 separate tools.

WHAT WAS BUILT

- HCN+ embeds KOGO OS natively into HCN, spanning Design, Execution, Approval, Catalog, Insights and Onboarding agents
- A second track covers Day 2+ Operations: Monitoring, Escalation, Scaling and Security agents across the full lifecycle
- 11 specialized agents delivered in 10 weeks, turning natural-language requests into validated, autonomous deployments

THE RESULT IN NUMBERS

4 Wks → 4 Days
Infrastructure Deployment Time

85%
Faster Deployment

75%
Day-2 Ops Efficiency Gain

1,000+
Engineers at Global Scale, Up From 400

THE RESULT

Infrastructure rollout time fell from 4 weeks to 4 days, an 85% reduction, with a 75% efficiency gain in Day-2 operations - now running at 1,000+ engineers globally, up from 400 at launch.

CASE STUDY 10 · CLIENT DEPLOYMENT

An AI Agentic Layer Across an Entire MSP

HITACHI
Inspire the Next

Hitachi Systems India (HSI)

IT Managed Services & Cybersecurity, MSP/MSSP | KOGO OS - Multi-Agent Automation across NOC, SOC, Infra Security

THE CHALLENGE

Running a 186-engineer MSP on manual processes across 7+ disconnected platforms, with alert triage, ticketing and remediation all handled by hand under strict SLAs.

WHAT WAS BUILT

- Alert triage detects in under 1 minute, completes root-cause analysis in under 3, and auto-remediates or escalates
- **Ticket lifecycle runs end to end:** email to ServiceNow ticket in under 1 minute, auto-assigned and SLA-chased
- SOC tier-1 triage correlates CrowdStrike and Securonix, filtering 80% of false positives before they reach an analyst

THE RESULT IN NUMBERS

₹4.3Cr
Net Year 1 Savings (~$516K)

76
FTEs Freed, 41% of Capacity

<4 mo
Payback Period

~5x
3-Year ROI Multiple

THE RESULT

Eight automation use cases now run across NOC, SOC and infrastructure security, cutting manual alert triage by 80% and MTTR by more than 50%, with a payback period under four months.

CASE STUDY 11 · CLIENT DEPLOYMENT

One Cockpit for the Entire BPO Floor

बैंक ऑफ़ बड़ौदा
Bank of Baroda

Tech Mahindra x Bank of Baroda

BFSI, Business Process Outsourcing | KOGO OS - Ethidhi BPO OS | In Production, Live at a PSU Bank

THE CHALLENGE

The BPO floor ran on 5-6 disconnected consoles for telephony, ACD, WFM and QA, with only 2% of conversations ever quality-checked and shrinkage entirely self-reported.

WHAT WAS BUILT

- AI Agent handles tier-1 autonomously, resolving 40%+ of queries in 15 languages, 24x7, with seamless human handoff
- AI Assist coaches the human agent in real time with next-best-reply suggestions and source-policy citations
- Tri-modal sentiment analysis reads text, audio tone and visual face-frame together, an industry first

THE RESULT IN NUMBERS

~$1M
Annual Savings per BPO Floor

426
Agents Live

15
Languages Natively

4·34/5
Average CSAT

THE RESULT

QA coverage moved from 2% manual sampling to 100% automated; five to six disconnected consoles became one cockpit, and shrinkage dropped 27% once it was reason-coded instead of self-reported.

CASE STUDY 11 · DEEP DIVE

One Cockpit for the Entire BPO Floor

बैंक ऑफ़ बड़ौदा
Bank of Baroda

Tech Mahindra x Bank of Baroda

BFSI, Business Process Outsourcing | Voice, Chat, Video & Email, Unified | In Production, Live at a PSU Bank

CAPABILITY ARCHITECTURE

01 Tier-1 AI Agent

- Resolves 40%+ of queries autonomously, 15 languages, 24x7
- Seamless handoff to a live agent with full context carried over
- No repeat questions for the customer

02 AI Assist, Live Coaching

- Listens on every live interaction in real time
- Next-best-reply suggestions with the policy citation behind each one
- Right process, first attempt - every time

03 Tri-Modal Sentiment Engine

- Text, audio tone and facial cues read together - an industry first
- Accurate, real-time satisfaction read for supervisors
- Replaces reliance on post-call surveys

PROVEN AT SCALE

1.5x Agent Capacity, Same Headcount

4 Channels Unified: Voice, Chat, Video, Email

15+ Languages, 24x7 Coverage

QA: **2% Manual Sample → 100% Automated**

Zero Data Egress, On-Prem or VPC

CASE STUDY 12 · CLIENT DEPLOYMENT

Autonomous Tax Data Retrieval System

Leading US Mortgage Tax Operations Provider

Financial Services, Mortgage Tax Operations | KOGO OS - Multi-Agent Voice + Vision Orchestration

THE CHALLENGE

Mortgage tax operations required pulling tax bills, due dates and delinquency data from hundreds of county offices entirely by hand, with only a small sample ever quality-checked.

WHAT WAS BUILT

- **Agent 1,** Voice AI, places and navigates outbound calls autonomously, retrieving tax amounts and due dates from county offices
- **Agent 2** transcribes and validates every call in real time, giving 100% QC coverage versus a 5-10% manual sample before
- **Agent 3,** Vision AI, runs overnight against county portals, clearing 60%+ of the next day's parcels before office hours

THE RESULT IN NUMBERS

80-90%
Overall Automation Accuracy

93%
Lower Cost vs Manual

60%+
Parcels Cleared Overnight

$75-95K
Annual Savings / 50K Parcels per Month

THE RESULT

Call handling time fell from about 7 minutes to 3-4 minutes per parcel; QC coverage moved from a 5-10% sample to 100% automated, running continuously across voice by day and vision by night.

CASE STUDY 12 · DEEP DIVE

Autonomous Tax Data Retrieval System

Leading US Mortgage Tax Operations Provider

Mortgage & BFSI | Voice AI, Computer Vision & Multi-Agent Orchestration | In Production

AGENT ARCHITECTURE

01 Voice AI

- Outbound call batches via cloud contact-center platform
- Navigates IVR autonomously (DTMF + listening), ~3-4 min/call
- Updates RETS in real time; escalates only when it can't retrieve data

02 Transcript & QC

- Transcribes every call via speech-to-text
- 100% QC coverage - validates against the RETS schema
- Immutable audit trail per extraction event

03 Vision AI, Overnight

- Runs during non-working hours via Computer Vision
- Gemini Vision AI + OCR reads portals and scanned bills
- Clears 60%+ of daily data at 95% accuracy before office opens

TECHNOLOGY STACK

Voice AI: Real-Time Conversational Model API

Computer Vision: Gemini Vision AI

CCaaS: RingCentral

Extraction & Analysis: Azure GPT-4o

Orchestration: Multi-Agent Orchestration Layer

HITL: KOGO Unified Agent Dashboard (8+ agents)

CASE STUDY 13 · CLIENT DEPLOYMENT

Compressing the Creative Production Cycle

Hindustan Unilever Limited

FMCG, Marketing & Media | KOGO OS - Marketing OS (Agentic Creative Operations) | Delivered via Langoor + 367 Agency

THE CHALLENGE

Creative production cycles, from brief to final asset, were slow and fragmented across teams and agencies, with no single operating layer connecting content, campaigns and compliance.

WHAT WAS BUILT

- Marketing OS runs agentic creative operations across content generation, campaign automation and brand compliance
- Content generation agents produce on-brand creative assets directly from a brief, without a manual production queue
- Campaign automation and brand compliance checks run inline, catching issues before assets ship rather than after

THE RESULT IN NUMBERS

2 Wks → 4 Hrs
Brief to Final Asset

10x
Content Velocity

70%
Creative Turnaround Reduction

2-Week Pilot
To Production at Hindustan Unilever

THE RESULT

Delivered for Hindustan Unilever Limited via Langoor and 367 Agency: creative turnaround compressed from two weeks to four hours, a 10x lift in content velocity, moving from a two-week pilot straight into production.

AI-Assisted Drone Situational Awareness

Concept Validation for an Indian Army Brigade

Defence | Working prototype built on the KOGO platform | Tested on recorded drone video

THE CHALLENGE

Analysing hours of drone footage manually can take substantial time. Commanders need a relevant, prioritised, explainable picture of potential threats that supports timely decisions.

HOW THE PROTOTYPE WORKS

Tested on recorded video. Live video is a design extension, once a live feed is connected.

VALIDATION AND EVIDENCE

11

Recorded drone videos supplied by the brigade

Up to ~30 min

Per video, ranging from a few minutes to approximately 30 minutes

~1 hr → 5-6 min

Officers' indicative estimate, not a measured benchmark

THE RESULT

A commander receives a clear, explainable threat picture without having to manually review hours of footage or type detailed queries. The system supports the decision; the officer retains authority over what happens next.

AI-Assisted Drone Situational Awareness

Concept Validation for an Indian Army Brigade

Defence | Working prototype built on the KOGO platform | Tested on recorded drone video

01 **Map-based command view** A command-centre view places drones, missions, flight paths, and video feeds on a map, zoomed to the brigade's own area of operations.

02 **Automatic video understanding** Frames are sampled at regular intervals and described by a vision model. Each observation is associated with a timestamp and location taken from the on-screen watermark and telemetry file, and stored in a searchable record.

03 **Threat scoring against unit-defined rules** A reasoning agent uses the brigade's five-layer threat-scoring framework. It rates each contact from low to critical and explains why. Changing the rule set changes the output without rebuilding the system.

04 **Plain-language operational queries** Officers can question an individual video or the entire command centre. The agent calculates distances to the command centre and friendly assets, estimated speed, time to reach locations, likely consequences, and recommended actions at query time. These values are not pre-loaded.

05 **One-tap operator analysis** A single “Analyse” action runs predefined questions agreed with officers. It surfaces a limited set of decision-relevant outputs and alerts, with a simple confirm-or-dismiss decision.

06 **Per-video and command-level conversations** Operators can examine an individual video feed through its own conversation or ask questions across all feeds.

07 **Designed for extension** The same pipeline can accept live video once a live feed is connected. The design also supports confidence scores on outputs and a potential path from situational analysis to course of action and mission planning.

Validation and evidence

Tested on 11 recorded drone videos supplied by the brigade. Placeholder friendly assets were used for context. Senior officers described the prototype as very close to how they envisage such a system working.

AI-Assisted Procurement Compliance Review

RailTel

Evidence-Backed Review of Procurement Policy Alignment | Interactive review platform backed by an Excel workbook record

SCALE OF THE REVIEW

400+
Provisions in the central framework reviewed: clauses, glossary terms, annexures and appendices

Nearly 250
Clauses indexed in RailTel's procurement manual

100+
Findings raised through the review

Roughly 1 in 5
Findings rated high priority

THE CHALLENGE

Reviewing a large procurement manual against a central government framework requires extensive manual comparison, evidence gathering, interpretation, and documentation. Gaps can be difficult to identify, prioritise, and verify efficiently.

Tailoring Views, scope, and workbook can be tailored to RailTel's needs; findings can be refined as the model is trained further and provided with additional context.

WHAT WAS BUILT

01 Clause-level review
Every provision in the central framework was reviewed: clauses, glossary terms, annexures and appendices. RailTel's full procurement manual was also indexed.

02 Prioritised findings
Ranked by severity of the gap, strength of evidence and the number of central provisions converging on one RailTel clause. Users can search, filter and open findings.

03 Evidence-backed comparison
Central and RailTel clauses side by side, with page numbers, quoted wording, reasoning and a recommended action, so users can verify findings against the source documents.

04 Coverage and chapter views
Shows how provisions were matched and where findings are concentrated. Contract Management, Bid Evaluation, Security and Payment, and Scrap Disposal carry the most findings.

05 Plain-English questions and answers
Officers query the review in plain English. Answers are calculated from the review database, so figures are traceable to the records. Results export as a PDF note.

06 Excel-backed record
The interactive platform is supported by an Excel workbook that serves as the record of the review.

Reading the findings A large majority of central provisions were traced to an equivalent in RailTel's manual; the remaining provisions were flagged as potential gaps for officers to verify. A meaningful set of findings identifies obligations with no matching provision in the RailTel manual.

THE RESULT *What would take weeks of manual comparison becomes a navigable, evidence-backed review that supports procurement decisions and audit readiness. The platform recommends; RailTel's officers decide.*

AI-Assisted End-to-End Order Lifecycle

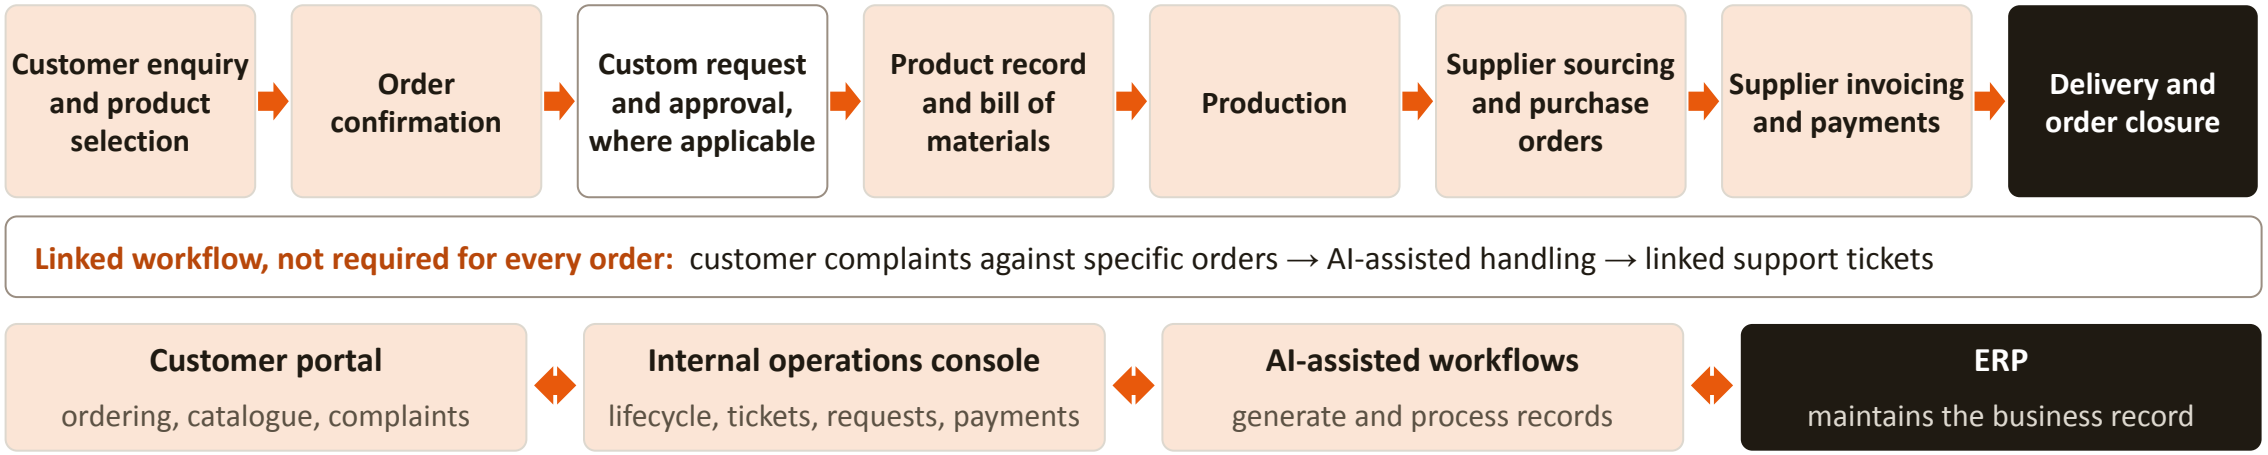

Jindal Aluminium

Connecting Customer Requests, Manufacturing, Procurement and Finance | Demonstration of the integrated workflow

THE CHALLENGE

The order lifecycle spans customer enquiries, product specifications, order creation, support, manufacturing, procurement, delivery, invoicing, and payments. When these stages are disconnected, organisations face manual data entry, fragmented visibility, and inconsistent information flow.

THE ORDER LIFECYCLE, AS DEMONSTRATED

THE RESULT

The demonstration shows how customer interactions, AI-driven workflows, manufacturing operations, procurement, support, and finance can function within one connected system.

AI-Assisted End-to-End Order Lifecycle

Jindal Aluminium

Connecting Customer Requests, Manufacturing, Procurement and Finance | Demonstration of the integrated workflow

01 Customer-facing product catalogue and ordering

Product specifications and prices are dynamically linked to master data. Customers can place orders and select delivery dates without manual data entry.

02 AI-assisted complaint management

Customers can raise complaints against specific orders. AI identifies the issue, determines urgency, assigns service-level deadlines, generates an initial response, and creates linked support tickets.

03 Custom product request workflow

Customers submit specifications, dimensions, and fabrication requirements. The internal team can review, approve, reject, or request additional information. After approval, AI assists in converting the design into a product record with a bill of materials, followed by quotation and sales order creation.

04 Unified internal operations console

A single console provides visibility into the order lifecycle, support tickets, custom requests, delivery statuses, invoices, payments, and operational insights.

05 Natural-language reporting assistant

An integrated AI assistant allows users to generate reports, charts, and tables through natural-language queries.

06 Connected order-to-payment pipeline

The workflow connects order confirmation and bill of materials creation with production, supplier sourcing, purchase orders, supplier invoicing, and payments. An AI-assisted workflow helps generate the records required at each stage using information from previous stages, while keeping the records accessible through the ERP.

Primary objectives Reduce manual data entry, improve operational visibility, maintain traceability, and ensure consistent information flow from the initial enquiry through order fulfilment and final payment.

CASE STUDY 17 · CLIENT DEPLOYMENT

AI-Enabled Operations for Garment Manufacturing

Large Garment Manufacturing Companies

Workforce Monitoring, Production-Line Management, ERP and CRM | Work in progress

THE CHALLENGE

Large garment manufacturing operations involve workforce attendance, production-line activities, issue reporting, customer and business processes, and enterprise operational management. These activities require coordination across the factory floor and business systems.

WHAT ARINOX AI IS WORKING ON

CCTV-based attendance analysis — FROM CCTV ANALYSIS

Analyse CCTV footage to support attendance-related operations.

Production-line issue management — FROM LINE MANAGERS

Line managers provide information about problems affecting production lines and workers. AI supports the organisation and management of this information.

ERP management — BUSINESS SYSTEMS

AI supports ERP-related business processes as part of the wider operational workflow.

CRM management — BUSINESS SYSTEMS

AI supports CRM-related processes and the coordination of customer-facing business activities.

End-to-end operational management Connect the relevant operational processes so that information can support a more unified view of manufacturing and business activities. The use case brings together workforce-related information, production-line issues, ERP, CRM, and wider operational management within an AI-enabled operating approach. Work in progress; no measured results are reported.

CASE STUDY 18 · - CLIENT NAME NOT DISCLOSED

AI-Enabled Retail Store Operations

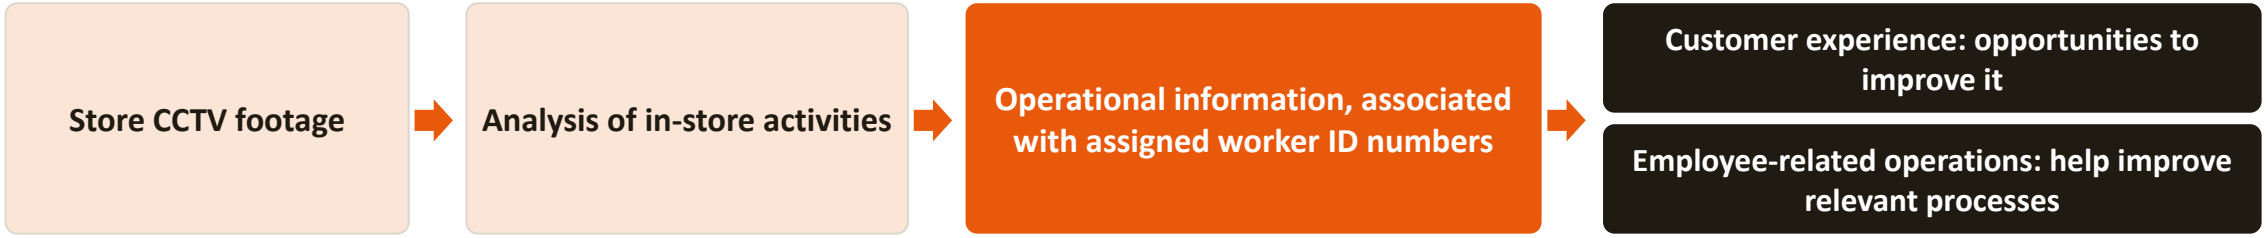

Mobile and Electronics Retail Chain

CCTV-Based Operational Intelligence for a Multi-Store Electronics Retail Chain | Work in progress

THE CHALLENGE

A retail chain must manage store-floor activities, customer interactions, employee-related operations, and day-to-day execution across its outlets. CCTV footage can provide operational information, but its value depends on turning that information into useful insights.

WHAT ARINOX AI IS WORKING ON

WHAT THE INFORMATION SUPPORTS

- Customer experience: store-level information supports the identification of operational opportunities that can improve the customer experience.
- Employee-related operations: worker-associated operational information helps improve relevant employee-related processes.

Assigned worker IDs Each worker is assigned an ID number. This is not described as a biometric or facial-recognition system.

Outcome and positioning The use case demonstrates how CCTV footage and worker-associated operational information can support improvements in store operations, customer experience, and employee-related processes. Work in progress; no quantified results are reported.

AI-Assisted Email Classification and Departmental Routing

Large Banking Institution

From a Common Inbox to Faster Departmental Responses | Work in progress | Bank name confidential

THE CHALLENGE

A large bank receives emails covering different issues, requests, and operational requirements. When incoming emails require manual sorting and forwarding, relevant departments may receive them late, slowing the response process.

THE WORKFLOW

The workflow can support automated handling as well as human-led responses, retaining the ability for human teams to review, handle, and respond to emails.

REPORTED OUTCOME

A couple of days

Response time, before

A couple of hours

Response time, after

THE RESULT

By reducing the manual effort involved in sorting and routing emails, the workflow supports a faster response process. Response time has reduced from a couple of days to a couple of hours.

POTENTIAL APPLICATION

Potential Relevance to Government Operations

Examples of potential relevance of the additional case studies. They are not claims that the same systems have been deployed in a government ministry.

A Situational awareness and decision support

Could be adapted for drone situational awareness and decision support in critical operational environments.

Draws on: CS 14; slides 22–23

B Procurement policy review and audit readiness

Could be applied to procurement policy comparison, evidence-backed review, and audit readiness.

Draws on: CS 15; slide 24

C Integrated workflows across functions

Could connect customer requests, internal operations, ERP, procurement, and finance in integrated workflows.

Draws on: CS 16; slides 25–26

D Coordination of operational issues and systems

Could support AI-assisted coordination of operational issues and enterprise systems.

Draws on: CS 17; slide 27

E Facility and store operational information

Could provide CCTV-derived operational information for store or facility management.

Draws on: CS 18; slide 28

F Email classification and routing

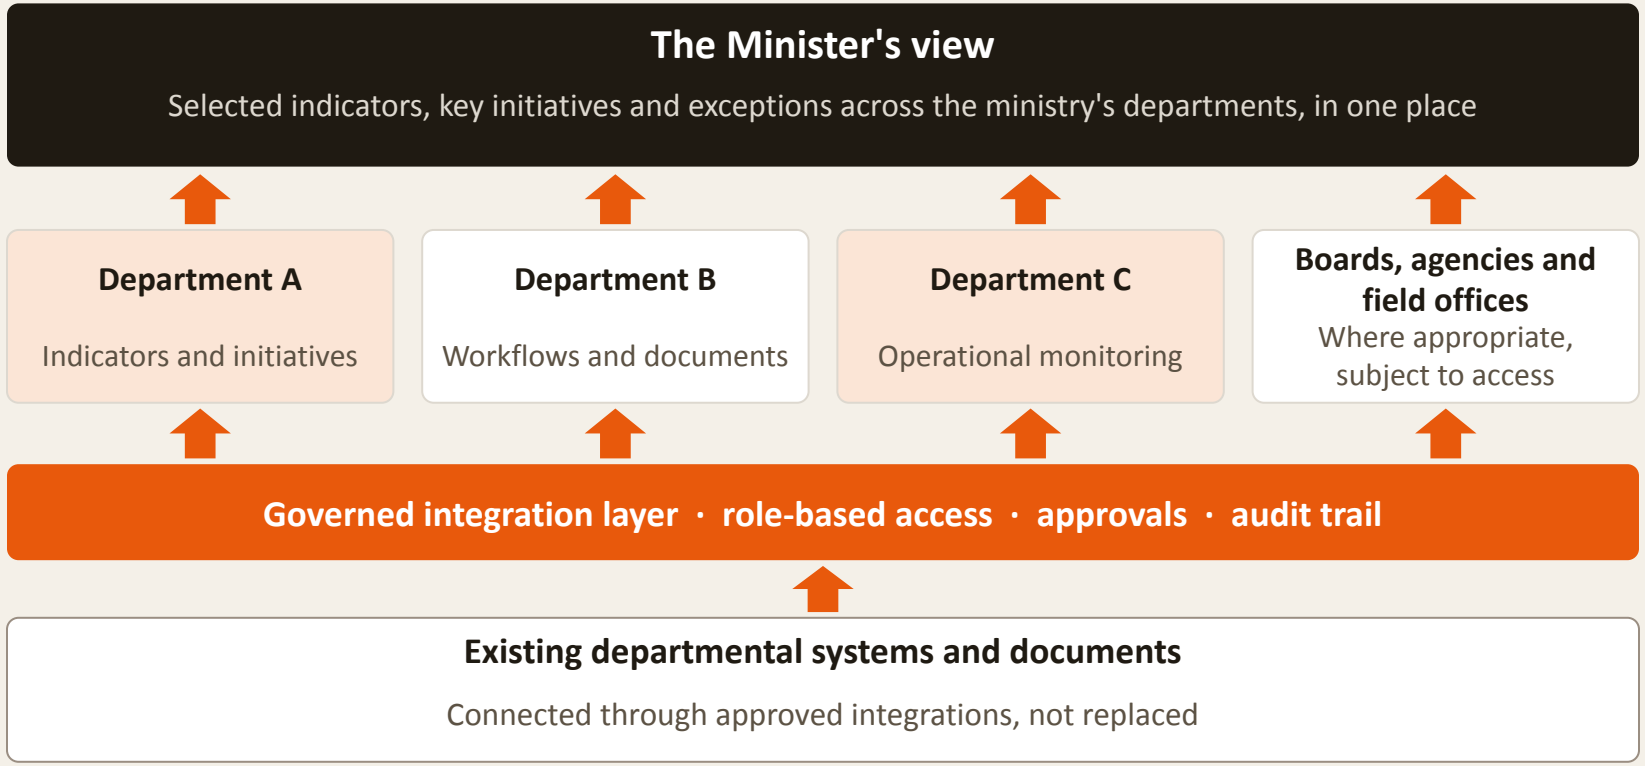

Could support email classification, departmental routing, and faster response handling.

Draws on: CS 19; slide 29

POTENTIAL APPLICATION

Adapting the Dashboard Approach for a Ministry

A governed dashboard, similar to the dashboard and cockpit capabilities in the case studies, could connect a ministry's departments and bring them together in one view for the Minister.

ACROSS MINISTRIES

The same approach could be adapted for each ministry, with its own departments and indicators

WHAT STAYS COMMON

Authorised data sources, role-based access, approvals and an audit trail

WHAT CHANGES

Indicators, data sources, users and level of detail, agreed with each ministry

EXISTING (documented): dashboard and cockpit capabilities in CS 02, 06, 07, 08 and 11

POTENTIAL : adaptation across ministries. No statewide implementation is claimed

DOCUMENTED PLATFORM CAPABILITY

Documented Components and Control Points

Illustrative representation of components documented in Arinox's KOGO OS materials. Actual controls and deployment mode depend on configuration and assessment.

Integration with government systems requires technical assessment and authorisation.

Platform component · Security and governance control · Deployment infrastructure · Existing users and systems

DOCUMENTED PLATFORM CAPABILITY

Governance Controls and Deployment Options

Deployment and data control

- Public cloud (AWS, GCP, Azure), private cloud, or on your premises with CommandCore™
- Runtime: On Prem, AWS, GCP, Azure, VPC, AirGapped
- CommandCore™ tiers: data centre scale, department scale, edge & remote sites
- Implemented example: CS 01, air-gapped on-premise and VPC/NDC

Source: pitch deck; CS 01

Role-based access (RBAC)

- Access controls for policy enforcement: SSO, LDAP, RBAC, Active Directory
- Access is given by role
- Access rights, audit records and human approvals are built in

Source: pitch deck

Permissions and human approvals

- Important decisions go to a person for approval
- CS 02: pre-approved fixes auto-execute; complex decisions route to a human with full context pre-filled
- CS 03: work orders routed for engineer approval
- CS 05: finance reviews only flagged exceptions

Source: pitch deck; CS 02, 03, 05

Audit and operational oversight

- Every AI action is recorded
- Spending, activity and approvals are visible and managed from one place
- Dashboards show spending by team, agent and AI model
- Traces, tokens, latency; red teaming and trace logs
- CS 05: immutable audit trail of every action

Source: pitch deck; CS 05

Compliance and certification requirements for any specific government deployment would be assessed with the department. Controls and deployment modes depend on configuration.

POTENTIAL APPLICATION

Potential Applications Across Government's Departments

Presented for assessment, not as completed government implementations. Each is subject to departmental requirements.

A Departmental information and document intelligence

Could apply document extraction, classification, search and validation to authorised departmental documents and records.

Draws on: CS 04

B Consolidated departmental dashboards

Could bring existing departmental information into a governed dashboard for operational visibility, subject to data availability and integration permissions.

Draws on: CS 06, 07, 08; slide 31

C Cross-departmental decision support

Could consolidate information from approved sources so authorised users can review operations and identify issues requiring attention.

Draws on: CS 01, 08, 11

D Administrative workflow automation

Could reduce repetitive work through document processing, task routing, exception handling and approval-based workflows.

Draws on: CS 03, 04, 05, 09

E Incident and operational monitoring

Could be assessed for suitable government operational environments, adapting documented monitoring and incident-management capabilities.

Draws on: CS 02, 10

F Secure and sovereign AI access

Could evaluate documented private deployment and governance options for sensitive government workloads.

Draws on: CS 01; slides 4, 6, 32–33

PROPOSED APPROACH · NOT AN AGREED PLAN

A Practical Path to Government AI Implementation

Arinox AI would work with the relevant government team to understand its priorities, evaluate existing systems and data, and agree suitable use cases and requirements.

1	2	3	4	5	6
Understand departmental priorities and operational requirements	Assess existing systems, data sources, access permissions and infrastructure	Identify and prioritise suitable AI use cases	Define security, deployment, governance and approval requirements	Agree a bounded implementation scope and success criteria	Evaluate outcomes before considering further rollout

Works with existing systems: SAP, Oracle, Salesforce, Microsoft 365 and Active Directory — connected, not replaced. No replacement of existing government systems is proposed.

Practical implementation experience

Sovereign, secure and governed AI

Potential application across government operations
